"local" consistency check: are all gate equations satisfied?

$$q_L \cdot x_a + q_R \cdot x_b + q_0 \cdot x_c + q_M \cdot (x_a x_b) = 0$$

$$\text{add: } 1 \cdot x_a + 1 \cdot x_b + (-1) \cdot x_c + 0 \cdot (x_a x_b) = 0$$

$$\text{mul: } 0 \cdot x_a + 0 \cdot x_b + (-1) \cdot x_c + 1 \cdot (x_a x_b) = 0$$

# PLONKish arithmetisation (custom gates)

TurboPLONK  
[[GW19](#)]

**vanilla PLONK gate:**  $q_L \cdot x_a + q_R \cdot x_b + q_0 \cdot x_c + q_M \cdot (x_a x_b) = 0$

**custom gates (arbitrary linear combinations):**

$$\underbrace{q_{\text{add}} \cdot (a_0 + a_1 - a_2)}_{\text{add gate}} = 0$$

# PLONKish arithmetisation (custom gates)

TurboPLONK  
[[GW19](#)]

**vanilla PLONK gate:**  $q_L \cdot x_a + q_R \cdot x_b + q_0 \cdot x_c + q_M \cdot (x_a x_b) = 0$

**custom gates (arbitrary linear combinations):**

$$\underbrace{q_{\text{add}} \cdot (a_0 + a_1 - a_2)}_{\text{add gate}} + \underbrace{q_{\text{mul}} \cdot (a_0 \cdot a_1 - a_2)}_{\text{mul gate}} = 0$$

# PLONKish arithmetisation (custom gates)

TurboPLONK  
[[GW19](#)]

**vanilla PLONK gate:**  $q_L \cdot x_a + q_R \cdot x_b + q_0 \cdot x_c + q_M \cdot (x_a x_b) = 0$

**custom gates (arbitrary linear combinations):**

$$\underbrace{q_{\text{add}} \cdot (a_0 + a_1 - a_2)}_{\text{add gate}} + \underbrace{q_{\text{mul}} \cdot (a_0 \cdot a_1 - a_2)}_{\text{mul gate}} + \underbrace{q_{\text{bool}} \cdot (a_0 \cdot a_0 - a_0)}_{\text{bool gate}} = 0$$

# PLONKish arithmetisation (custom gates)

TurboPLONK  
[[GW19](#)]

vanilla PLONK gate:  $q_L \cdot x_a + q_R \cdot x_b + q_0 \cdot x_c + q_M \cdot (x_a x_b) = 0$

custom gates (arbitrary linear combinations):

$$\underbrace{q_{\text{add}} \cdot (a_0 + a_1 - a_2)}_{\text{add gate}} + \color{red}{y} \cdot \underbrace{q_{\text{mul}} \cdot (a_0 \cdot a_1 - a_2)}_{\text{mul gate}} + \color{red}{y^2} \cdot \underbrace{q_{\text{bool}} \cdot (a_0 \cdot a_0 - a_0)}_{\text{bool gate}} = 0$$

verifier challenge to keep gates linearly independent

# PLONKish arithmetisation (permutation)

PLONK  
[[GWC19](#)]

- **wires** carry values into and out of gates

# PLONKish arithmetisation (permutation)

PLONK  
[GWC19]

- **wires** carry values into and out of gates

"global" consistency check: do the wires correctly join the gates together?

\* in Groth16, routing is baked into the trusted setup; we can't do this for universal SNARKs

# PLONKish arithmetisation (permutation)

PLONK  
[GWC19]

$w_0$	$w_1$	$w_2$	gate
$w_0[0]$	$w_1[0]$	$w_2[0]$	+
$w_0[1]$	$w_1[1]$	$w_2[1]$	$\times$

each wire (column  $i$ ) is encoded as a Lagrange polynomial  $w_i$  over the powers (rows) of an  $n^{\text{th}}$  root of unity  $\{1, \omega, \dots, \omega^{n-1}\}$ , where  $\omega^n = 1$ :

$$w_i(\omega^j) = w_i[j]$$

# PLONKish arithmetisation (permutation)

PLONK  
[GWC19]

$w_0$	$w_1$	$w_2$	gate
$w_0[0]$	$w_1[0]$	$w_2[0]$	+
$w_0[1]$	$w_1[1]$	$w_2[1]$	$\times$

each wire (column  $i$ ) is encoded as a Lagrange polynomial  $w_i$  over the powers (rows) of an  $n^{\text{th}}$  root of unity  $\{1, \omega, \dots, \omega^{n-1}\}$ , where  $\omega^n = 1$ :

$$w_i(\omega^j) = w_i[j]$$

to enforce equality of wires, use **permutation argument (deep-dive)**;  
show that swapping  $w_2(\omega^0)$  with  $w_0(\omega^1)$  doesn't change the polynomials.

# PLONKish arithmetisation (lookup)

UltraPLONK  
[[halo2](#)]

$w_0$	$w_1$
42	SHA(42)
0	0
69	SHA(69)
...	...
0	0

problem: SHA is expensive to do in-circuit

# PLONKish arithmetisation (lookup)

UltraPLONK  
[[halo2](#)]

$w_0$	$w_1$	$q_{\text{lookup}}$	$t_0$	$t_1$
42	SHA(42)	1	0	SHA(0)
0	0	0	1	SHA(1)
69	SHA(69)	1	2	SHA(2)
...	...	...	...	...
0	0	0	255	SHA(255)

solution: load precomputed SHA (e.g. for 8-bit values) as lookup table

# PLONKish arithmetisation (lookup)

UltraPLONK  
[[halo2](#)]

$w_0$	$w_1$	$q_{\text{lookup}}$	$t_0$	$t_1$
42	SHA(42)	1	0	SHA(0)
0	0	0	1	SHA(1)
69	SHA(69)	1	2	SHA(2)
...	...	...	...	...
0	0	0	255	SHA(255)

$$\begin{aligned} & (q_{\text{lookup}} \cdot w_0, t_0) \\ & (q_{\text{lookup}} \cdot w_1, t_1) \end{aligned}$$

# PLONKish arithmetisation (lookup)

UltraPLONK  
[[halo2](#)]

$w_0$	$w_1$	$q_{\text{lookup}}$	$t_0$	$t_1$
42	SHA(42)	1	0	SHA(0)
0	0	0	1	SHA(1)
69	SHA(69)	1	2	SHA(2)
...	...	...	...	...
0	0	0	255	SHA(255)

$$\begin{aligned} & (q_{\text{lookup}} \cdot w_0 + (1 - q_{\text{lookup}}) \cdot 0, \quad t_0) \\ & (q_{\text{lookup}} \cdot w_1 + (1 - q_{\text{lookup}}) \cdot \text{SHA}(0), \quad t_1) \end{aligned}$$

lookup default value when  $q_{\text{lookup}}$  is not enabled,  
so that lookup argument passes on every row

# PLONKish arithmetisation (lookup)

UltraPLONK  
[[halo2](#)]

$w_0$	$w_1$	$q_{\text{lookup}}$	$t_0$	$t_1$
42	SHA(42)	1	0	SHA(0)
0	0	0	1	SHA(1)
69	SHA(69)	1	2	SHA(2)
...	...	...	...	...
0	0	0	255	SHA(255)

the lookup argument is a more permissive version of the permutation argument. it enforces that:

every cell in a set of **input columns** is equal to  
**some** cell in a set of **table columns**

# PLONKish arithmetisation (lookup)

UltraPLONK  
[[halo2](#)]

$w_0$	$w_1$	$q_{\text{lookup}}$	$t_0$	$t_1$
42	SHA(42)	1	0	SHA(0)
0	0	0	1	SHA(1)
69	SHA(69)	1	2	SHA(2)
...	...	...	...	...
0	0	0	255	SHA(255)

the lookup argument is a more permissive version of the permutation argument. it enforces that:

every **expression** in a set of **input columns** is equal to  
**some expression** in a set of **table columns**

more on this in the deep-dive!

# PLONKish arithmetisation

we conceptualise the circuit as a **matrix** of  $m$  columns and  $n$  rows

# PLONKish arithmetisation

we conceptualise the circuit as a **matrix** of  $m$  columns and  $n$  rows,  
over a given **finite field**  $\mathbb{F}$  (so the cells contain elements of  $\mathbb{F}$ )

# PLONKish arithmetisation

each column  $j$  corresponds to a Lagrange interpolation polynomial  $p_j(X)$

# PLONKish arithmetisation

each column  $j$  corresponds to a Lagrange interpolation polynomial  $p_j(X)$  evaluating to  $\mathbf{p}_j(\omega^i) = \mathbf{x}_{ij}$ , where  $\omega$  is the  $n^{\text{th}}$  primitive root of unity.

## aside: fast Fourier transform (FFT)

how to encode vector  $[a_0, a_1, \dots, a_{n-1}]$  as polynomial  $p(X)$ ?

treat each  $a_i$  as the **evaluation** of  $p(X)$  at a certain point  $x_i$ .  
(for efficiency, we pick  $x_i$  to be the  $i$ th power of the root of unity  $\omega^i$ , where  $\omega^n = 1$ .)

$$p(X) := \sum a_i L_i(X),$$

where  $L_i(X)$ 's are the Lagrange bases

$$L_i(X) := \frac{\prod_{j \neq i} (\omega^i - \omega^j)}{\prod_{j \neq i} (X - \omega^j)} = \begin{cases} 1 & \text{if } X = \omega^i, \\ 0 & \text{otherwise} \end{cases}$$

we will be working over the evaluation domain  $H = \{\omega^i\}$ ,  $i = 0..N$

# PLONKish arithmetisation

**instance columns** contain inputs **shared**  
between prover/verifier (e.g. public inputs)

# PLONKish arithmetisation

**advice columns** contain private  
values witnessed by the prover

# PLONKish arithmetisation

# example: Fibonacci sequence

write this in tomorrow's session!

$i_0$	$a_0$	$a_1$	$a_2$	$q_{\text{fib}}$
1	1	1	2	1
	2	3	5	1
13	5	8	13	0

## example: Fibonacci sequence

$i_{\theta}$	$a_{\theta}$	$a_1$	$a_2$	$q_{\text{fib}}$
1	1	1	2	1
	2	3	5	1
13	5	8	13	0

$$q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{2, \text{cur}}) =$$

$\theta$

## example: Fibonacci sequence

$i_\theta$	$a_\theta$	$a_1$	$a_2$	$q_{\text{fib}}$
1	1	1	2	1
	2	3	5	1
13	5	8	13	0

$$q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{2, \text{cur}}) =$$

$\theta$

$$q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{\theta, \text{next}}) =$$

$\theta$

# example: Fibonacci sequence

$i_\theta$	$a_\theta$	$a_1$	$a_2$	$q_{\text{fib}}$
1	1	1	2	1
	2	3	5	1
13	5	8	13	0

$$q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{2, \text{cur}}) =$$

0

$$q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{\theta, \text{next}}) =$$

0

$$q_{\text{fib}} \cdot (a_{1, \text{cur}} + a_{2, \text{cur}} - a_{1, \text{next}}) =$$

0

# example: Fibonacci sequence

$i_\theta$	$a_\theta$	$a_1$	$a_2$	$q_{\text{fib}}$
1	1	1	2	1
	2	3	5	1
13	5	8	13	0

$$\begin{aligned}
 q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{2, \text{cur}}) &= \\
 \theta \\
 q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{\theta, \text{next}}) &= \\
 \theta \\
 q_{\text{fib}} \cdot (a_{1, \text{cur}} + a_{2, \text{cur}} - a_{1, \text{next}}) &= \\
 \theta
 \end{aligned}$$

global permutation:  $a_2[i] = a_\theta[i + 1]$

# example: Fibonacci sequence

$i_\theta$	$a_\theta$	$a_1$	$a_2$	$q_{\text{fib}}$
1	1	1	2	1
	2	3	5	1
13	5	8	13	0

$$\begin{aligned} q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{2, \text{cur}}) &= \\ \theta & \\ q_{\text{fib}} \cdot (a_{\theta, \text{cur}} + a_{1, \text{cur}} - a_{\theta, \text{next}}) &= \\ \theta & \\ q_{\text{fib}} \cdot (a_{1, \text{cur}} + a_{2, \text{cur}} - a_{1, \text{next}}) &= \\ \theta & \end{aligned}$$

global permutation:  $a_2[i] = a_\theta[i + 1]$

exercise: can you see how to constrain this locally (using  $q_{\text{fib}}$ )?

# example: Fibonacci sequence

$i_0$	$a_0$	$a_1$	$a_2$	$q_{\text{fib}}$
1	1	1	2	1
	2	3	5	1
13	5	8	13	0

$$\begin{aligned} q_{\text{fib}} \cdot (a_{0,\text{cur}} + a_{1,\text{cur}} - a_{2,\text{cur}}) &= \\ 0 \\ q_{\text{fib}} \cdot (a_{0,\text{cur}} + a_{1,\text{cur}} - a_{0,\text{next}}) &= \\ 0 \\ q_{\text{fib}} \cdot (a_{1,\text{cur}} + a_{2,\text{cur}} - a_{1,\text{next}}) &= \\ 0 \end{aligned}$$

global permutation:

- $i_0[0] = a_0[0]$  // initialisation
- $i_0[0] = a_1[0]$  // initialisation
- $i_0[2] = a_2[2]$  // output

$$\begin{array}{c} c_0[a^0]_1 + c_1[a^1]_1 + c_2[a^2]_1 + c_3[a^3]_1 + c_4[a^4]_1 + c_5[a^5]_1 + c_6[a^6]_1 \dots + c_{N-1}[a^{N-1}]_1 + c_N[a^N]_1 \\ = \sum [c_i][a^i]_1 = C \end{array}$$

- $\text{pp} = ([a^0]_1, \dots, [a^N]_1, [a]_2) \in (\{\mathbb{G}_1\}^N, \mathbb{G}_2) \leftarrow \text{Setup}(1^\lambda, N), \mathbb{G}_1, \mathbb{G}_2 \text{ cryptographic groups}$
- $C \in \mathbb{G}_1 \leftarrow \text{Commit}(\text{pp}; \mathbf{f}) = \sum [c_i][a^i]_1$

## aside: discrete logarithm hardness

the **discrete log problem** is defined as follows. given:

- a group element  $G \in \mathbb{G}$ , and
- a group element  $[a]_1 = [a]G$ ,

to recover  $a$ , the discrete logarithm of  $[a]_1$  in  $G$ .

this problem is assumed to be **hard** in **cryptographic groups** (e.g. **elliptic curves**)

so, given  $G_1 \in \mathbb{G}$  and an encoding  $\mathbf{srs} = [\tau^0]G_1, [\tau^1]G_1, \dots, [\tau^d]G_1$   
 $= [\tau^0]_1, [\tau^1]_1, \dots, [\tau^d]_1$ ,

it's **hard** to recover the powers of the secret point  $\tau$ .

## prove: KZG commitment scheme

$$f(z) = y \implies \frac{f(z) - y}{X - z} = q(X) \implies q(X)(X - z) = f(X) - y$$

- $\text{pp} = ([\mathbf{a}^0]_1, \dots, [\mathbf{a}^N]_1, [\mathbf{a}]_2) \in (\{\mathbb{G}_1\}^N, \mathbb{G}_2) \leftarrow \text{Setup}(1^\lambda, N), \mathbb{G}_1, \mathbb{G}_2 \text{ cryptographic groups}$
- $C \in \mathbb{G}_1 \leftarrow \text{Commit}(\text{pp}; \mathbf{f}) = \sum [c_i][\mathbf{a}^i]_1$
- $\Pi \leftarrow \text{Prove}(\text{pp}, C, i)$  proof size:  $O(1)$

# prove: KZG commitment scheme

$$f(z) = y \implies \frac{f(z) - y}{X - z} = q(X) \implies q(X)(X - z) = f(X) - y$$

$$\Pi := [\mathbf{q}(X)]_1 = \sum [q_i] [\mathbf{a}^i]_1$$

- $\text{pp} = ([\mathbf{a}^0]_1, \dots, [\mathbf{a}^N]_1, [\mathbf{a}]_2) \in (\{\mathbb{G}_1\}^N, \mathbb{G}_2) \leftarrow \text{Setup}(1^\lambda, N), \mathbb{G}_1, \mathbb{G}_2 \text{ cryptographic groups}$
- $C \in \mathbb{G}_1 \leftarrow \text{Commit}(\text{pp}; f) = \sum [c_i] [\mathbf{a}^i]_1$
- $\Pi \leftarrow \text{Prove}(\text{pp}, C, i)$  proof size:  $O(1)$

## verify: KZG commitment scheme

$$f(z) = y \implies \frac{f(z) - y}{X - z} = q(X) \implies q(X)(X - z) = f(X) - y$$

$$\Pi := [\mathbf{q}(X)]_1 = \sum [q_i][\mathbf{a}^i]_1, \text{ check: } e(\Pi, [\mathbf{a}-z]_2) = e(C - [y]_1, [1]_2)$$

- $\text{pp} = ([\mathbf{a}^0]_1, \dots, [\mathbf{a}^N]_1, [\mathbf{a}]_2) \in (\{\mathbb{G}_1\}^N, \mathbb{G}_2) \leftarrow \text{Setup}(1^\lambda, N), \mathbb{G}_1, \mathbb{G}_2 \text{ cryptographic groups}$
- $C \in \mathbb{G}_1 \leftarrow \text{Commit}(\text{pp}; f) = \sum [c_i][\mathbf{a}^i]_1$
- $\Pi \leftarrow \text{Prove}(\text{pp}, C, i)$
- $\{0,1\} \leftarrow \text{Verify}(\text{pp}, C, i; \Pi)$  verification time:  $O(1)$

aside: bilinear pairings

$$e: \mathbb{G}_1 \times \mathbb{G}_2 \rightarrow \mathbb{G}_T$$

$$e([a]P, [b]Q) = [ab] e(P, Q)$$

thank you!

any questions?
